

Sprint 1 planning document

Focusing On:

- Documents
 - Storage of Documents
 - Uploading of documents
 - Renaming documents
 - Display of active documents
 - Via a download link
 - Archiving documents(initially without restoration, as a flag)
 - Document marking as important(filtered to top of list)
 - Replacing documents
 - History of changes
- Folders
 - Base root folder only at this time, meaning no work to be done at this time

Backend system

To avoid reusing any code, ruby on rails and ruby based distributions have been banned, allowing for a clean slate for V2.

Python is banned to encourage skill development in other languages.

Typescript for backend is considered.

Implementation of parts

Milestones	Section	Requirments	Implementatio n plan	Estimated effort	Dependance on another prt
1	Document storage	A method to accept uploads of documents A method to catalog documents	SQL lite will be used as document storage due to its compatibility with node js. See below for document schema Storage will be on the filesystem with a reference in the db, using mutler	1-2 hours	Timestamps

Milestones	Section	Requirments	Implementatio n plan	Estimated effort	Dependance on another prt
1	Document upload	Documents require the document file reference and the name of the document to be added	Uploading adds the file to the filesystem in static storage, with a db reference using mutler to gain access.	2 hours	Document storage
2	Renaming documents	Documents must be referenced by id, not name A method to edit documents, linked to file change	Document names can be updated in SQL with a simple query.	1 hour	Document storage
1	Display of documents	Ability to show database references to documents Ability to category	Documents can be read from SQL and put into the main page as needed	1-2 hours	Document storage
2	Document Archival	Database with an enum flag to say archived, Displayed documents do not show	A simple flag marking the document as archived will result in it being innacessable, all that needs	1 hour	Document storage
2	Document Marking	A flag in the database to set a document as important A sorting on the main page to put important documents first	A different flag in the SQL also provides this link. Sorting in the main page to put important at the top of the pile	1 hour	Document storage
3	Document replacement	A method to edit documents, linked to renaming Ability to drop reference in previous	The old file has to be kept on the database, but the new file takes its reference away	2 hours	Document storage

Milestones	Section	Requirments	Implementatio n plan	Estimated effort	Dependance on another prt
3	Document History	A method to record the time and type of change	Any changes to flags or timestamps or names should be listed as a change. Each file should also have a changelist file as needed, updated with text passing Each file passes back the program	Half a day roughly, due to need to flag each part	Document storage, Flags, Timestamps
1	Timestamps	Timestamps for both original upload and most recent change	Stored in SQL and updated, any updates trigger history Called via calling the current timestamp	1 hour or less, needed for all other parts.	Baseline, can be done without other parts

SQL schema

ID	File name	File reference	Created at	Updated at	History reference	Importanc e flag	Archive flag
Number(int), iterating	String	String to file reference	Timestamp	Timestamp	String to file reference	Single digit enum	Single digit enum
